

Occupancy Planner Instructions

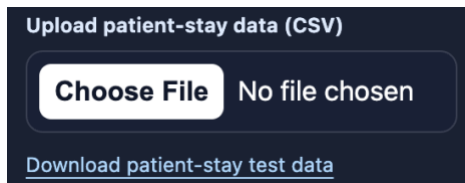

Step 1. Prepare your data

- Create a CSV file with one row per patient admission and the following columns:
- **site** — The ICU/NICU site where the patient was admitted. Use a consistent name or identifier for each site.
 - **admission_date** — The date the patient was admitted, formatted as YYYY-MM-DD
 - **los_days** — The patient's length of stay in days.

Step 2. Upload your data

- Select **Upload patient-stay data** and choose your CSV file. Select **View demo example** to explore the interface with sample data. **Download patient-stay test data** to view an example dataset.

Step 3. Add current beds

- Input the number of beds currently at each site.

Step 4. Run the model

- Click **Run model** to process the data and generate model outputs.

Step 5. Explore planning options

- Adjust **Admission demand**, **Target average utilization rate**, **Target maximum utilization rate**, **Forecasting window**, or **Capacity strategy** to compare planning scenarios.

Step 6. Review and download results

- Review the expected utilization and capacity results, then use **Download graphs and results** to save the outputs.
